

Aevum

Future begins today.

Aevum means an age — time that endures and accrues rather than runs out. Wealth is meant to grow the same way: gently, one ordinary step at a time. Most money apps are built on fear — budgets, streaks, the guilt when you slip; they're very good at making you anxious and not very good at making you wealthier. Aevum starts from the opposite premise: a small nudge you set yourself turns everyday spending into savings — a quiet push in the right direction that never becomes a shove. No pressure, no shame, no discipline required — just a calmer path to real wealth that grows while you live your life.

Getting started

This page walks you from a fresh account to your first recorded transaction.

Just exploring? Try it with sample data first. If you're running your own Aevum instance, you can generate realistic *synthetic* statements (no real financial data), import them, and get a feel for the app risk-free — then [reset your data](#) and start fresh from real statements when you're ready. See [Your data & privacy](#).

1. Create your account

Sign up with your email and a password. Aevum uses your details to set sensible defaults — for example, your currency is chosen from your country, so amounts show up the way you expect from the start. You can refine everything later in your profile and preferences.

2. Sign in

Log in with your email and password. If you've turned on two-factor authentication, you'll also enter a code from your authenticator app — see [Account & security](#).

3. Look around

After signing in you land on your **dashboard** — a summary of recent activity, your current week's tax, and budgets. The top navigation takes you to Transactions, Budgets, your bills, and Settings.

4. Add your first transaction

Go to **Transactions** → **Add**. At minimum you'll choose:

- **Who** it was with (a *beneficiary* — a merchant like "Coffee Shop", or a person),
- **How much**,
- **Whether it's money out (an expense) or in (income)**, and

- **The date.**

If you've set a rule for that beneficiary before, Aevum fills in the categories for you automatically. Save, and you'll see it in your list.

That single transaction is enough for Aevum to start working — it categorizes it, sets aside any consumption tax, and folds it into this week's bill.

What next?

- Understand what that tax is: [The consumption tax](#).
- Set a spending limit: [Budgets](#).
- Bring in lots of history at once: [Importing statements](#).

FAQ

Do I have to enter everything by hand? No — you can [import a statement](#) from your bank or UPI app and Aevum will read the transactions for you.

Can I change my currency later? Yes, in your preferences. It's just pre-filled from your country to save you a step.

I added a transaction — where did the "tax" come from? Aevum automatically applies a small consumption tax to most spending. The next page explains exactly how it's calculated.

The consumption tax & your weekly bill

This is the idea at the heart of Aevum. It's worth five minutes.

Why a "tax" on your own spending?

Most budgeting apps just *tell you* what you spent. Aevum turns each expense into a small act of saving. Every time you spend, a fraction of it is set aside as a **self-imposed consumption tax** — money you're quietly provisioning for future expenses of the same kind. The tax isn't a punishment; it's a forced savings habit attached to the act of spending.

The money is real: it's collected into your [savings account](#), not just tallied on a screen.

How much is taxed

Every expense is sorted into a **type**, and each type has its own tax rate. The defaults are:

Type of spending	Examples	Default tax
Discretionary	dining out, shopping, entertainment	~10%
Essential	groceries, utilities, transport	~5%
Fixed commitments	rent, loan EMIs	0% (not taxed)
Exempted	things you choose to exclude	not taxed

Discretionary spending is taxed a little more than essential — the more optional the spend, the bigger the provision it builds. **You can change every one of these rates** on the Taxation Rules page in Settings; the numbers above are just the starting points.

Income, transfers between your own accounts, and the tax payments themselves are never taxed.

Budgets add a penalty on top

The base tax above applies to *all* qualifying spending, whether or not you're over budget. Separately, you can set [budgets](#) per category. If you **overspend a budget**, Aevum adds a **penalty** on top of the base tax for the spending that crossed the line — a sharper nudge. Default penalties are around 20% for essential categories and 50% for discretionary ones, and they're adjustable too.

So there are two distinct things happening:

1. **Base tax** — always, on every qualifying expense → builds your savings.
2. **Penalty** — only when you bust a budget → an extra cost for going over.

The weekly bill

Aevum totals your tax (plus any penalties) over a week and presents it as a single bill. Weeks run **Monday to Sunday** in your timezone.

If a bill goes unsettled past its grace period it's flagged **overdue**, and very stale bills may be **expired** — but in normal use you'll just see bills accrue, finalize each week, and get paid.

Prefer to skip the tax? It's optional

Aevum's automatic **tax mode** runs the weekly cycle for you — finalizing each week's bill and, if you like, settling it automatically. You don't have to use it:

- **Turn it off** to run in manual mode. Your tax then stays a running tally and never comes due unless you choose to generate a bill — so you can use Aevum as a straightforward spending tracker (categories, budgets, reports) without the tax driving anything.
- **It can switch itself off, too.** If unpaid bills pile up past a safe limit, Aevum automatically turns tax mode off, clears the stale backlog, and notifies you — so a forgotten bill never quietly snowballs. Turn it back on whenever you're ready.

FAQ

Is this a real/government tax? No. It's entirely self-imposed — a personal accountability and savings tool. You set the rates, and the money goes to your own savings account.

Can I turn the tax off for something? Mark it as exempted, or categorize it as a fixed commitment — neither is taxed by default.

I edited an old transaction. Does my old bill change? Finalized bills aren't rewritten. Instead, Aevum posts the difference as a small adjustment to your current week, so history stays accurate without being re-litigated.

Where can I change the rates? Settings → Taxation Rules. There's one rate per spending type, and you can tune both the base tax and the breach penalty.

Your savings account

The consumption tax isn't just a number on a screen — it goes somewhere. That somewhere is your **savings account** (you may also see it called your *tax pot*).

Where the tax goes

When you settle a weekly bill, the money moves **out of your everyday account and into your savings account**. So the discipline of the tax turns into a real, growing balance — a provision you've built up for future expenses, one purchase at a time.

Paying your bill

You can settle bills two ways:

- **Manually** — record a payment against a bill when you move the money.
- **Automatically** — turn on auto-settlement and Aevum applies your savings transfers to your outstanding bills for you, oldest first.

Either way, the result is the same: the taxed amount ends up set aside in your savings account.

If bills pile up unpaid, Aevum will step in to protect you — it can pause auto-settlement and flag the backlog so things don't quietly spiral.

Why we suggest two bank accounts

Aevum works best when your **everyday spending** and your **savings** live in two separate real-world bank accounts:

- Every expense draws down your everyday account by **more than the sticker price** — the purchase *plus* its self-imposed tax. That shrinking balance is the point: less disposable income sitting around is a quiet, constant nudge to save rather than spend.
- The money you set aside lands in a dedicated savings account, out of sight and out of temptation. Its first job is to build an **emergency buffer** — a cushion for the unexpected — before any of it becomes money you invest.

You *can* run on a single account: designate one account as your savings / emergency account in Aevum and mark bills paid when you actually move the money aside (for example, into a fixed deposit within the same bank). But we **strongly recommend two separate accounts** — physically segregating spending from savings is what makes the discipline real and keeps your emergency fund from being quietly spent.

What's coming next

Today, the savings account is exactly that: a place your provisions accumulate. It's also the **foundation for where Aevum is heading**. The plan is to grow it from a passive store of savings into an active one — putting the balance you've built to work through **investments and a portfolio**. When that lands, the same account you've been filling with everyday discipline becomes the engine for longer-term goals.

This guide will grow with those features. For now: every taxed purchase is quietly building the balance they'll build on.

FAQ

Is the savings account a real bank account? It's a dedicated account *inside Aevum* that tracks your set-aside savings. You move real money into it when you settle bills, so the balance reflects money you've genuinely provisioned.

Do I have to pay every bill? To keep your savings building, yes — that's the point. Auto-settlement makes it effortless, and unpaid bills are flagged so nothing slips through.

What's the "committee account" I saw mentioned? That's the name for this account's *future* role — once investing and portfolio features arrive, it actively manages the balance rather than just holding it. Same account, bigger job.

Transactions

A transaction is any money that moves — an expense you paid or income you received. Everything else in Aevum builds on these.

The image shows a dark-themed 'Add transaction' dialog box. It has a title bar with a close button (X). The form contains several fields: 'Beneficiary' with a text input showing 'Uber'; 'Amount' with a numeric input showing '216.53' and a small currency icon; 'Type' with a dropdown menu showing 'Debit'; 'Date' with a date input showing '2026-06-16' and a calendar icon; 'Tags' with a search input 'Search tags...' and a tag 'Taxis (Uber, Ola, etc.) x'; and 'Notes' with a text area containing 'Payment via Cash'. At the bottom are two buttons: 'Create Transaction' (highlighted in blue) and 'Cancel'.

Adding a transaction

Go to **Transactions** → **Add** and fill in:

- **Beneficiary** — who the money was with. This is either a **merchant** (a shop, service, or business) or a **person**. Start typing and pick an existing one, or add a new one on the spot.
- **Amount**.
- **Type** — money out (an expense) or money in (income).
- **Date**.
- **Categories (tags)** — usually filled in for you (see below).
- **Notes** and, optionally, which **bank account** it came from.

Categories fill themselves in

If you've set a [rule](#) for that beneficiary, selecting them **auto-fills the categories**. You can accept them as-is, or adjust them for this one transaction. If you change them, Aevum asks whether you want to:

- **use the change for this transaction only**, or

- **update the rule** so it applies next time too.

That keeps your one-off tweaks from quietly rewriting a rule you rely on.

Editing and deleting

Open any transaction to edit it. Changing its amount or categories updates your tax and budgets automatically — including the current week's bill. You can also delete a transaction; transactions that came from an imported statement are handled a little differently (you re-categorize rather than delete).

Viewing your transactions

The Transactions page lists everything with filtering, sorting, and search. You can also view spending grouped by beneficiary to see where your money actually goes.

FAQ

What's a "beneficiary"? Just the other side of the transaction — the merchant you paid or the person you sent money to. Grouping by beneficiary is how Aevum learns your patterns and auto-categorizes future spending.

I record income too? Yes. Income isn't taxed, but recording it gives you the full picture and helps with budgets and recurring detection.

Why did my weekly bill change when I edited a transaction? Because the tax is calculated live. Editing a transaction in the current week recalculates that week immediately; editing one in a finalized week posts a small adjustment to the current week instead.

Beneficiaries

A **beneficiary** is the other side of a transaction — the shop you paid or the person you sent money to. Beneficiaries are how Aevum understands *who* your money goes to, which is what powers automatic categorization and your spending-by-payee insights.

Beneficiaries

Merge+ Add New

All 4Business 2Person 1Unknown 1

Search by name or alias...

NAME	ALIASES	RELATIONSHIPS	TYPE	ACTIONS
Amazon System	(AMZN, Amazon Pay)	Merchant	Business	...
Corner Chai Stall	(chaiwala)	Merchant	Business	...
Priya Sharma		FriendLandlord	Person	...
UPI/unknownpayee@okhdfc		—	Unknown	...

Two kinds: merchants and people

- **Merchants** are businesses — a coffee shop, your electricity provider, an online store.
- **People** are individuals — a friend you split a bill with, family, a landlord.

The distinction helps Aevum reason about your spending and keeps merchant analytics separate from personal transfers.

Aliases

The same payee often shows up under slightly different names — especially in imported statements ("STARBUCKS", "Starbucks India", "STARBUCKS #4471"). You can give a beneficiary **aliases** so all those variations map to one payee, and Aevum keeps your history tidy instead of scattering it across near-duplicates. When you import a statement, matching against aliases is part of how transactions get attributed to the right beneficiary.

Merging duplicates

If two beneficiaries turn out to be the same payee, **merge** them. Merging folds one into the other — combining their transaction history and aliases — so your reports and categorization stay accurate. It's

the cleanup tool for when duplicates slip in over time.

How beneficiaries connect to the rest of Aevum

- **Categorization** — a [rule](#) maps a beneficiary to categories, so every transaction with that payee is tagged automatically.
- **Transactions** — you pick a beneficiary when [adding a transaction](#); if it has a rule, your categories fill in for you.
- **System beneficiaries** — Aevum seeds a few (they carry a "System" chip). You can edit them; the chip just notes where they came from.

FAQ

Do I have to create beneficiaries up front? No — you can add one on the spot while entering a transaction, and imports create them for you.

What's the difference between a beneficiary and a category? A beneficiary is *who* the money involved; a category is *what kind* of spending it was. A rule connects the two ("this payee → these categories").

I have the same shop listed twice. Merge them — your history and aliases combine into a single payee.

Categories & rules

Categories (Aevum calls them **tags**) are how your spending gets sorted — and sorting is what drives your tax, budgets, and reports. This page explains how they work and how to put them on autopilot.

Categories are a tree

Tags are **hierarchical**: broad categories contain narrower ones (for example, *Food* might contain *Groceries* and *Dining*). When you tag a transaction with a child, its parents apply too — so a Dining expense also counts toward Food automatically.

Every tag also has a **type** that decides how it's taxed — discretionary, essential, a fixed commitment, or exempted. See [the consumption tax](#) for what each type means.

System categories

Aevum ships with a starter set of categories so you're productive immediately. These carry a small **"System"** chip to show Aevum created them. You can still rename them, re-tag them, or adjust them — the chip stays as a note about where the category came from, not a lock. (A few core system categories are protected from deletion because the app relies on them.)

Rules put categorization on autopilot

A **rule** links a beneficiary to one or more categories: *"anything from Coffee Shop → Dining."* Set a rule once and Aevum tags every future transaction with that beneficiary for you.

You create and manage rules on the **Categorization Rules** page (in Settings). There's at most one rule per beneficiary, and like categories, the ones Aevum seeded wear a "System" chip.

Categorization Rules

Auto-tag rules that classify a beneficiary's transactions for you.

Creating a rule while adding a transaction

You don't have to go to the rules page first. While [adding a transaction](#):

- Picking a beneficiary that already has a rule **auto-fills** its categories.
- If you change those categories, Aevum shows you exactly what's different and asks whether to use the change **just this once** or **update the rule**.
- If you choose to create or update a rule, Aevum saves your transaction and takes you to the rules page with everything pre-filled, so you finish in the place that owns rules.

FAQ

What's the difference between a category and a rule? A category is a label (with a tax type). A rule is an automatic instruction: "give this beneficiary these categories." Categories describe; rules automate.

Why does editing a "System" category keep the chip? The chip records that Aevum originally created the category — editing it doesn't change that history, so the chip stays. It never stops you from editing.

What if a transaction has no matching rule? It's left in a general "uncategorized" state (and taxed at the standard rate) until you categorize it or add a rule.

Budgets

A budget is a limit you set for a category over a period — say, ₹8,000 on Dining each month. Budgets are how you tell Aevum what "too much" means for *you*.

Budgets live on the **Expense Tracker** — a single month-scoped page (its nav label is "Expense Tracker") that brings three things together: what you've spent in each category, the limit you've set for it, and how you're tracking against that limit. You set, adjust, and watch your budgets all in one place.

Expense Tracker

Your spending at a glance — totals, trends, and per-category budgets. A breach adds a penalty (a % of the spend) on top of the base tax; see Taxation Rules for the defaults, or override per-budget below.

Budgeting mode

OffManualAuto

You set per-category budgets yourself; a breach stacks a penalty on the base tax.

Setting a budget

On the **Expense Tracker**, pick a category, set the amount and the period, and save. You can have as many budgets as you like, across different categories.

What happens when you go over

Staying within a budget costs you only the normal [consumption tax](#). **Going over adds a penalty** on top of the base tax — but only for the spending that actually crosses the line:

- Spend up to your limit → base tax only.
- The transaction that tips you over the limit, and everything after it that period → base tax **plus** a penalty.

A refund or credit that brings you back under the limit eases off the penalty again. In other words, the penalty tracks where you *actually* stand against the budget, moment to moment.

You can set the penalty rates yourself on the Taxation Rules page (defaults are around 20% for essential categories and 50% for discretionary ones).

Keeping an eye on budgets

The Expense Tracker shows each category's spending against its limit for the month (with an over-budget marker when you've crossed one), and your dashboard carries a summary. Aevum also sends you a notification when you breach a budget — so a penalty is never a surprise.

FAQ

Is a budget required? No. Without a budget, spending in that category is simply taxed at the base rate. Budgets are opt-in limits that add the penalty layer on top.

Does the penalty apply to the whole month's spending? No — only from the point you cross the limit onward, not retroactively to everything you spent that period.

Can different categories have different limits and penalties? Yes. Budgets are per category and per period, and penalty rates are set per spending type.

Recurring bills

Some expenses repeat — rent, subscriptions, the monthly phone bill. Aevum learns these from your history and forecasts them, so they never catch you off guard.

How it works

You don't have to set recurring expenses up by hand. As you record (or import) transactions, Aevum watches for patterns — the same beneficiary, around the same amount, on a regular cadence (weekly, monthly, yearly) — and **forecasts the next occurrences**.

Forecasts are predictions, not transactions: Aevum never invents spending in your ledger. When the real expense happens, Aevum **reconciles** it against the forecast so your actuals stay clean and your predictions stay honest.

What you'll see

Recurring

Patterns we've detected in your transactions. Confirm the ones that should keep forecasting, edit anything that shifted, or dismiss what no longer applies.

Detected 2 **Confirmed 1** Upcoming

				Edit	Dismiss

- Upcoming recurring expenses Aevum expects, with their predicted dates and amounts.
- Reconciliation as those expenses actually land.
- Adjustments when your patterns change — a forecast that stops matching reality is revised or retired.

Keeping control

Anything you manage yourself stays yours: Aevum won't silently overwrite a recurring item you've taken control of. The automatic detection is there to help, not to take the wheel.

FAQ

Does Aevum create transactions for recurring bills automatically? No. It forecasts them so you can see them coming; the actual transaction is recorded when the expense really happens (by you, or via an import).

How does it know something is recurring? From repetition in your history — same beneficiary, similar amount, regular timing. The more history Aevum has, the better its forecasts.

A forecast is wrong — what do I do? Patterns adapt over time as your real activity changes. Items you manage yourself are never auto-modified.

Importing statements

Rather than typing in transactions one by one, you can upload a statement from your bank or UPI app and let Aevum read it.

Supported statements

Aevum reads PDF statements from popular UPI apps — **PhonePe**, **Google Pay**, **Paytm**, and the list keeps growing. Pick the matching format when you upload (or let Aevum detect it for you).

How to import

1. Go to **Transactions** → **Import** (or the Upload Statement page) and choose your PDF.
2. Confirm the statement type. Aevum tries to match it automatically; if it can't, you pick from the list.

3. Submit. Importing happens in the background — you don't have to wait on the screen. You'll see the job move through *parsing* → *categorizing* → *done*, and a small dock keeps you updated from any page.
4. When it finishes, your transactions are in, already **auto-categorized** using your **rules** and attributed to the right account.

After importing

Imported transactions behave like any others — they're taxed, counted against budgets, and feed recurring detection. Anything Aevum couldn't confidently categorize is left in a general state for you to tidy up, and you can re-tag any imported transaction.

FAQ

My statement type isn't listed. Aevum supports the common UPI apps today and adds more over time. If detection fails, choose the closest matching format manually.

Is my statement stored? The import reads your statement to extract transactions; the goal is to get the data into your ledger. Treat your statements as you would any financial document.

Some imported transactions look uncategorized. That's expected when there's no rule for a beneficiary yet. Categorize them once (or add a [rule](#)) and future imports will sort themselves.

Account & security

Aevum holds your financial picture, so it takes account security seriously. Here's what's available and how to use it.

How Aevum protects your account

Some protections are always on — no setup required:

- **Your password is never stored.** It's hashed with bcrypt (a strong, salted, one-way algorithm), so Aevum can't read it and it's never returned in any response.
- **Brute-force attempts are blocked.** Repeated wrong-password attempts temporarily lock the account, and sign-in and recovery requests are rate-limited.
- **Your second factor is protected at rest.** If you enable 2FA, the secret is stored encrypted, and your backup codes are hashed and single-use.
- **A disabled account can't be muscled open.** The controls that lock an account are designed so they can't simply be bypassed through recovery.

The features below — 2FA, device verification, session control — are the ones *you* switch on, on top of those defaults.

Two-factor authentication (2FA)

Turn on 2FA to require a one-time code from an authenticator app (Google Authenticator, Authy, etc.) in addition to your password. To set it up, go to your account security settings, scan the QR code with your app, and confirm a code to finish enrolling.

Two-factor authentication

- Two-factor authentication is enabled.

You'll be asked for a 6-digit code from your authenticator every time you sign in. Use a backup code if you lose access to your authenticator.

8 backup codes remaining.

[Disable two-factor authentication](#)

When 2FA is on, signing in asks for your code after your password. It also protects sensitive actions like changing your email.

Backup codes

Enrolling gives you a set of **backup codes**. Keep them somewhere safe — each one gets you in once if you ever lose access to your authenticator. They're single-use.

New-device verification

When you sign in from a device Aevum hasn't seen before, it emails you a verification code to confirm it's really you. Verified devices are remembered, so you're not prompted every time on your own machines.

Managing your sessions

You can see where you're signed in and sign out individual sessions — handy if you've used a shared or public computer. There's also a one-click link in your new-device email to revoke a device you don't recognize.

Changing your email or password

- **Password** — changing it signs out your *other* sessions (you stay signed in where you are) and emails you a heads-up.
- **Email** — because your email is your sign-in identity, changing it requires confirming a code sent to the new address (and your 2FA code if enabled). Your old address is notified too.

If you're locked out

Use **account recovery** to regain access via a code sent to your email. Recovery is rate-limited and, when 2FA is enabled, still respects it — so recovery can't be used to slip past your second factor.

Deleting your account

You can delete your account from settings. Deletion has a **grace period**: your account is deactivated immediately but not erased right away, so you can change your mind and **cancel the deletion** within the window. After that, it's permanently removed.

Notifications

A notifications feed (the bell in the top bar) keeps you informed — a new weekly bill, a budget breach, a failed import, or a security setup that needs finishing. You choose which kinds of notifications you want in **Account** → **Notifications**.

FAQ

Do I need 2FA? It's optional but strongly recommended — it's the single biggest improvement to your account's safety.

I lost my authenticator and my backup codes. Use account recovery via your email to regain access, then re-enroll 2FA.

Will I get prompted on every sign-in from my own laptop? No — once a device is verified it's remembered. New or unrecognized devices get the extra check.

I deleted my account by mistake. As long as you're within the grace period, open the cancel-deletion link and your account is restored.

Your data & privacy

Aevum holds a detailed picture of your finances, so you should know exactly what you can do with that data and what happens to it. This page lays it out plainly.

Your data is yours

Everything you put into Aevum — transactions, beneficiaries, categories, budgets, bills — belongs to you, and Aevum gives you direct control over it: export it, hide it on screen, delete parts of it, reset all of it, or close your account entirely.

It's also protected: your password is bcrypt-hashed (never stored in readable form), 2FA secrets are encrypted at rest, and sign-in is rate-limited and lockout-protected — see [How Aevum protects your account](#). The rest of this page is about the controls *you* have over your data.

Just exploring? Use sample data

You don't have to hand over a single real number to find out whether Aevum is for you. If you're running your own instance, you can generate realistic **synthetic** statements (made-up payees and amounts — no personal data), import them, and play with the full app risk-free. When you're ready for the real thing, do a [data reset](#) and start fresh from your actual bank statements.

The generator and steps are in [CONTRIBUTING](#).

Export your data

You can export your data at any time as **CSV** (for spreadsheets) or **JSON** (for developers and backups). Exports are per-resource — your transactions, your beneficiaries, and so on — so you can take exactly what you need.

Export your data

Pick what to download. Two or more come back as one .zip with a clean file per item.

Mask amounts on screen

Turn on **amount masking** to blur every monetary value in the app — handy when you're on a train, sharing your screen, or just don't want your balances visible at a glance. Masked amounts reveal when you hover or focus on them, so you can still check a figure when you need to without unmasking everything.

Delete individual things

You don't have to wipe everything to remove something. You can delete a single **transaction**, a **beneficiary**, account details, and other individual records directly — useful for cleaning up a mistaken entry or removing a record you'd rather not keep.

Reset all your data

A **data reset** is a clean restart: it wipes every piece of financial data you own — transactions, bills, budgets, categories, recurring forecasts — while keeping your **account itself** (your login, profile, and preferences) intact. Think of it as emptying the app back to day one without having to sign up again.

A reset is irreversible. If you only want to step away, you don't need to reset — your data simply waits for you.

Delete your account

You can close your account entirely. Deletion has a grace period, so you can change your mind and cancel within the window before anything is permanently removed — see [Account & security](#).

What's kept after deletion — and why

Closing your account removes your personal data, with one deliberate, narrow exception you should know about.

Because Aevum's consumption tax corresponds to **real money you actually set aside**, your tax/bill records aren't purely cosmetic — they reflect genuine financial activity the app guided. For **legal and regulatory compliance**, a minimal record is retained after deletion:

- **Bill-level taxation records** — the books of what was billed (these must survive an account closing, the way a ledger outlives any one member).
- **An overall spend rollup** — a single high-level total, with **no per-category detail**.
- **Your email address** — kept only for authorized future correspondence.

Everything else that identifies you is dropped. This retained record is the narrow exception to "delete means gone" — and it exists specifically because the data maps to real-world transactions, not to keep tabs on you.

FAQ

Can I get all my data out before I leave? Yes — export to CSV or JSON first, then reset or delete. Your export is a full copy you keep.

Does masking amounts hide them from Aevum, or just from the screen? Just from the screen — it's a display setting for privacy in public or shared situations. Your data is unchanged; hover or focus to peek at a value.

If I reset my data, do I lose my account? No. A reset clears your financial data but keeps your account, profile, and preferences. To remove the account itself, use account deletion.

Why is anything kept after I delete my account? Only the minimum required for compliance, because your tax bills reflect real money set aside. It's a small, fixed record (billing totals + your email), not your full history.
